1 Applications

1. Google Docs

- create and edit documents
- sync between multiple devices
- view PDF docs/presentations
- upload and manage files

2. Documents to Go

- edit/view/create word, excel, PowerPoint docs
- supports password protection
- Google Docs support
- bi-directional sync

3. SecureSafe

- secure file and data storage
- double encryption
- secure AES-256 and RSA-2048 encryption
- https
- MFA with SMS
- send files up to 2GB to recipients

4. Quick Office Pro

- create/edit/share Microsoft Office files
- offline file access

2 Contrast

2.1 Similarities

- Similarly to the **SecureSafe** app, E-me uses AES-256 symmetric encryption standard to securely store and transfer documents.
- E-me allows users to upload their PDF documents.
- Users have quick and secure access to their data and files.

2.2 Differences

- E-me only supports PDF documents.
- E-me uses End-to-End Encryption over HTTPS to communicate with the clients.
- Users are able to **generate** their PDF docs using predefined templates filled out with their personal data.
- All PDF documents (**generated or uploaded**) will be verified for authenticity by the system administrators (later government) and will receive a digital signature to mark their authenticity.
- Authorities can request access to users' documents in order to verify their identity or other personal information (this access is temporary).
